

Automatic Menu Navigation

Overview

Unity's automatic UI navigation doesn't work well for complex UI layouts and setting up navigation manually can take quite a bit of time. Because of that there are several dedicated scripts that automatically set up navigation for a settings menu.

Note: *Provided automatic navigation setup is related to the order of settings in the settings collection. When a workflow with manual input element setup is used the automatic menu navigation may not be useful if the order of input elements in the menu differs from the settings order in the settings collection.*

Basic

The SettingsMenu_UGUI_NavigationSetter_Basic script will set up the navigation in a way that the order of the settings in the list determines the navigation. This means the first settings will navigate to the second, the second to the third and so on.

Basic Loop

The SettingsMenu_UGUI_NavigationSetter_Basic_Loop script extends the basic navigation to connect the first and last settings so you can cycle/loop through the entire list of settings.
